Hi Hiring Team,

Building a Sales and Inventory System during my 300-hour internship at Chimes Consulting gave me practical exposure to how frontend interfaces, backend logic, and databases come together in a full-stack application. I would welcome the opportunity to bring that experience to your team as a Junior Full Stack Web Developer.

Through this internship, I worked on a web application using Laravel, PHP, React, TypeScript, Tailwind CSS, Inertia.js, and SQLite. I also developed academic and personal projects, including a Point of Sale system, a student management system, and a responsive portfolio website. These experiences helped me practice implementing features, troubleshooting issues, and working across different parts of the development process.

I use Git and GitHub for development workflows and incorporate AI tools such as ChatGPT, Gemini, Codex, and Claude where useful for research, coding assistance, debugging, and reviewing possible solutions. My approach varies by task: I write code directly when appropriate, use AI support when it adds value, and focus on understanding and checking the final implementation.

I would appreciate the opportunity to discuss how my hands-on project experience and willingness to learn could support your development team. My GitHub profile is linked above for your review.

Best regards,
Francis Lee Recanil
